

1 atm = 760 mmHg = 760 torr = 101.325 kPa = 14.7 psi

Background:

Pressure is defined as Force / Area such as pounds per square inch (psi). The weight of air pushing down per square inch is 14.7 pounds per square inch or **14.7 psi**.

A barometer can be used to measure pressure. A column of mercury (Hg) that is 0.760 meter (760 mm) tall has the same weight as a column of air from sea level to the edge of the stratosphere. The height of this column is a good measure of air pressure... **760 mmHg**.

Evangelista Torricelli did a lot of experiments with pressure and so 1 mmHg is also called 1 torr. So, air pressure has a value of **760 torr**. This amount of pressure is also called **1 atm** (one atmosphere) because it *IS* the atmosphere.

In metric units, pressure is Newtons (force) per square meter (area). One Newton is not very much pressure... about the weight of a small apple (get it... apple... Newton)... and if that force is exerted over a square meter, the amount of pressure is very small and called a pascal (Pa). It is more useful to talk of kilopascals (kPa) which would be the weight of 1000 small apples exerted over a square meter. Air pressure is equal to **101.3 kPa**.

Since each of these values (see the top of the page) represent the same amount of pressure, any two of them can be used as a conversion factor. You can convert one pressure unit into another.

Example:

What is 515 mmHg in kPa?	$515 \text{ mmHg} \times \frac{101.3 \text{ kPa}}{760 \text{ mmHg}} = 68.6440789 \text{ kPa} = 68.4 \text{ kPa}$
--------------------------	------------------------------------------------------------------------------------------------------------------

Problems:

- | | |
|------------------------|-----------------------|
| 1. 745 mmHg into psi | 5. 522 torr into kPa |
| 2. 727 mmHg into kPa | 6. 1.10 atm into psi |
| 3. 52.5 kPa into atm | 7. 800. mmHg into atm |
| 4. 0.729 atm into mmHg | 8. 125 kPa into torr |
